

SAFER DISINFECTANT USE DURING COVID-19 FOR EARLY CHILDCARE PROVIDERS

What caregivers can do to prevent transmission and use safer products

⚠️ WHAT ARE THE CONCERNS?

Traditional disinfectants can contain chemicals with harmful health effects. Children are especially susceptible.

Bleach (sodium hypochlorite):

An acute eye, throat and skin irritant. Causes and triggers asthma.

Quats (quaternary ammonia):

Skin and throat irritants. Have been linked to reproductive harm in animal studies.

🧼 CLEANING VS DISINFECTING

Cleaning gets rid of germs and dirt from surfaces or objects. Cleaning doesn't necessarily kill germs; it reduces their numbers and the risk of infection by just washing germs down the drain. Soap alone is very effective at destroying the new coronavirus. Cleaning can involve washing your hands, using a laundry machine, or using an all purpose cleaner on a surface or object.

Disinfecting, actually kills germs on surfaces or objects by using chemicals. Disinfecting doesn't physically remove germs, but kills them in place. Disinfecting chemicals work by attacking certain parts of the germs and breaking them down.

🧴 SAFER DISINFECTANTS

Safe disinfectant active ingredients that are effective against the virus:

- Alcohol (ethanol or isopropyl)
- Hydrogen peroxide
- L- Lactic acid
- Citric acid

Products with safer ingredients on the [EPA's List N](#) of products registered for use against SARS-CoV-2 include:

- Clorox Commercial Solutions Hydrogen Peroxide Disinfecting Cleaner, Disinfectant, and Wipes
- Diversey's Oxivir TB Ready-To-Use Liquid, Wipes, Five 16, and Diversey's Alpha HP Multi-Surface Disinfectant Cleaner
- Lysol Disinfecting Bathroom Cleaner
- GOJO Industries PURELL Multi-Surface Disinfecting Cleaner, Disinfectant, Wipes, and Surface Disinfectant

🕒 WHEN TO CLEAN

Cleaning should be the first line of defense against germs. Whenever possible, use soap and water to wash supplies, toys, desks, etc. Materials that have been left undisturbed for over a week only need to be cleaned. Surfaces to be disinfected should be cleaned first.

🕒 WHEN TO DISINFECT

Disinfectants are an important tool for caregivers when the appropriate precautions are taken. Disinfectants should be used on high-touch surfaces like doorknobs and changing tables. Proper use of disinfectants is critical, including how long the surface needs to stay wet (contact time). Follow instructions carefully and ventilate the room as much as possible.

☀️ LIMIT THE NEED TO DISINFECT IN OTHER WAYS

Decreasing the amount of times you disinfectant will limit exposure to harmful chemicals. Areas unoccupied or objects untouched for 7 or more days need only routine cleaning. Safe ways to limit disinfectants include:

- Spending as much time outdoors as possible
- Creating individual supply kits for each child
- Creating a seating chart so children do not switch desks/tables
- Putting used toys away for a week so that only routine cleaning is necessary
- Rotating spaces so that only routine cleaning is necessary

BEYOND DISINFECTING: WHAT CARE PROVIDERS AND SCHOOLS CAN DO TO REDUCE TRANSMISSION DURING COVID-19

SURVIVAL ON SURFACES

The virus that causes COVID-19 can remain active on different surfaces for varying amounts of time and is a potential source of transmission.

- Plastic 3-7 days
- Stainless Steel 2-7 days
- Glass 4 days
- Wood or Cloth 2 days
- Cardboard 4 hours
- Paper and Tissue Paper 3 hours

INCREASE HANDWASHING AND SANITIZING

Handwashing with soap should be the #1 priority to reduce transmission among staff and children.

- Create new handwashing routines before entering and exiting new spaces, before and after eating, after using the bathroom and after playing outside.
- Consider placing portable hand washing stations around the facility to increase access for hand washing.
- Consider installing touchless faucets or foot pedal operated sinks.
- Use hand sanitizer when hand washing is not possible. Make sure to store out of reach, especially for younger children.

INCREASE VENTILATION

Ventilation and filtration provided by HVAC systems can reduce the airborne concentration of the novel coronavirus.

- When weather permits, prop open doors and open windows to increase air flow.
- Consider putting ozone-free, portable, free-standing HEPA air purifiers in classrooms.
- Consider enhanced filtration (higher MERV filters) for your HVAC system.
- For more information and suggestions, a good resource is [ASHRAE.org](https://www.ashrae.org)

Follow [CDC](https://www.cdc.gov) and [local health department](#) guidance on temperature and screening procedures, face masks, physical distancing, staggering drop off and pick ups, class and group sizes, and isolation procedures when an individual is sick.

WHAT TO DO WITH SUPPLIES, TOYS, BOOKS

- Disinfectants are not effective on porous objects. Remove soft toys and objects that cannot be regularly laundered.
- Choose toys and supplies that can be easily washed with soap and water. Designate a bin for toys and supplies that have been used. Ideally these will be cleaned with soap and water, with no disinfecting needed after.
- Rotate different toys or learning materials to only be used once a week. Materials that have been left undisturbed are low risk.
- Create individual supply kits for each child.
- Books and paper goods do not need to be disinfected, but should not be immediately shared among children.

SPEND MORE TIME OUTDOORS

The risk for transmission is lower in outdoor settings as it's easier to maintain physical distance, there are fewer surfaces to touch, and sunlight and humidity deactivates the virus more rapidly.

- Set up learning and play spaces outside for small groups
- Consider adding shade structures, seating, portable blackboards.
- Use natural materials, like leaves and sticks for creative activities.
- Ask parents to send layers, extra clothing, hats, etc.
- A good resource for more outdoor learning ideas is [Green Schoolyards America](https://www.green-schoolyards.org)

WHY CHOOSING SAFER DISINFECTANTS AND CLEANERS IS IMPORTANT FOR EARLY CHILDCARE PROVIDERS AND SCHOOLS

! WHAT ARE THE CONCERNS?

Many traditional cleaning products and disinfectants can contain toxic chemicals with harmful health effects. In fact, companies don't have to list all of the chemicals that go into their cleaning products and disinfectants, so it's impossible to know the full extent of what you or your children are being exposed to. Furthermore, chemical residues from products can build up over time. Children are especially susceptible to these harmful chemicals because they're going through important developmental stages and put hands and objects in their mouths. They can also breathe in fumes and absorb chemicals through their skin.

There are two ingredients that pose health risks in disinfectants. Bleach, or sodium hypochlorite, is an acute eye, throat, and skin irritant. It also causes and triggers asthma. Quats, or quaternary ammonia compounds, are skin and throat irritants that have been linked to reproductive harm in animal studies.

There are many other chemicals in cleaning and disinfecting products that are also concerning. Synthetic fragrances often contain phthalates, which can increase risk for asthma, allergies, cancers, disrupt hormones, or impact development. Products can also have high VOCs (volatile organic compounds), or fumes that can cause asthma and headaches and even more serious health effects with prolonged exposure.

GREEN CLEANING

Green cleaning uses safer products and proven methods that are better for human health and the environment. Having a strong chemical smell, which is oftentimes associated with being clean, is not necessary. Thankfully there are newer products that are effective and safe. A simple way to start is to look for products that are third party certified by [EPA's Safer Choice label](#), [Cradle to Cradle](#), [Greenguard certified](#), or [UL Ecologo](#).

Cleaning with a safe all purpose cleaner and water will physically remove dirt, grime, and germs. Routine cleaning reduces the need for specialty products, strong disinfecting chemicals, and future repairs and replacements. Implementing effective cleaning tools, like microfiber cloths and HEPA filter vacuums is also an important part of a green cleaning program. You can find out more about green cleaning for early childhood education facilities and schools with the [Green Cleaning Toolkit](#) from UCSF, UC Berkeley, and Informed Green Solutions.

SAFER DISINFECTANTS DURING COVID-19

There are disinfectants that are as effective at killing germs (including the virus causing COVID-19), without the harmful health effects for children and staff. Look for products with active ingredients like ethanol, isopropyl, hydrogen peroxide, L- Lactic acid, and citric acid. Make sure to carefully read and follow all directions on the product label, and note the contact time. For disinfectants effective against SARS-CoV-2, search for products with safer active ingredients that are on the [EPA's List N](#) of registered products.

HAND WASHING AND HAND SANITIZER DURING COVID-19

WHAT TYPE OF SOAP?

Any soap, liquid or bar soap, works to prevent transmission of the COVID-19 virus. Soap breaks down the fatty layer surrounding virus particles, effectively destroying it. Water helps rinse everything down the drain.

Antimicrobial or antibacterial soap is not necessary. There is no evidence it helps reduce germs more than plain old soap.

HAND WASHING OR HAND SANITIZER?

Hand washing is always preferred to hand sanitizer. The CDC recommends washing with soap and water because it reduces and removes all types of germs and chemicals on hands. Wash your hands when you cook, eat, use the bathroom, change diapers, blow your nose, cough, sneeze, care for others or animals, and upon returning home.

Hand sanitizer is great when you can't wash hands such as when you're out running errands or in your car. However, it isn't as effective at killing certain types of germs or if your hands are dirty or greasy. Also, hand sanitizer does not remove harmful chemicals, like pesticides, flame retardants, or lead dust on hands.

HAND SANITIZER

Make sure you use a gel or spray hand sanitizer with at least 60% alcohol (ethanol or isopropanol).

How to Use Hand Sanitizer Properly

- Use enough product to completely wet all areas of your hands.
- Rub for at least 20 seconds or until your hands feel dry.

Other Things To Look Out For

- Avoid sanitizers with synthetic fragrances. These products often contain phthalates, which are chemicals that disrupt hormones
- Make sure that kids do not have unsupervised access to hand sanitizer. There has been a large increase in calls to Poison Control Centers due to accidental ingestion.
- Do not spray disinfectants or cleaning products on your hands or body. These are only meant for use on surfaces.

HOW TO WASH YOUR HANDS

Proper hand washing reduces germs and prevents transmission of the COVID-19 virus and other sicknesses too.

1. Wet your hands with either warm or cold water and then apply soap.

2. Lather your hands by rubbing them vigorously together with the soap. Make sure to scrub the back of your hands, in between your fingers, and around and under your nails. Don't forget your thumbs too. Lathering and scrubbing helps lift dirt, grease, and germs from your hands.

3. If you scrub in every nook and cranny it should take you at least 20 seconds. You can count or learn a tune that is about 20 seconds long. "Happy Birthday" from beginning to end twice is about 20 seconds.

4. Rinse your hands well under running water. Water washes away the dirt, grease, and germs.

5. Dry your hands using a clean towel.

SAMPLE EMAIL TO CHILD CARE DIRECTOR OR SCHOOL ADMINISTRATOR ABOUT SAFER DISINFECTING DURING COVID-19

Dear [Preschool Teacher or Director, Daycare Director, or School Official],

My name is [NAME] and I am the parent of [CHILD'S NAME]. I know that reopening schools during a pandemic must be incredibly difficult and I want to thank you for all the hard work that you are doing. We all want to protect the health of our kids and the staff, which is why I wanted to share some information I recently learned about safe disinfecting and COVID-19.

Disinfecting products that contain bleach and quats (quaternary ammonia compounds) can cause and trigger asthma and have other harmful health effects. As COVID-19 is requiring an increase in disinfecting, repeated use of these chemicals could have harmful health consequences for both cleaning staff and students. Fortunately, there are safer EPA approved disinfectant products that are effective against the coronavirus and other germs. These disinfecting products use active ingredients that are less harmful to human health and the environment, including hydrogen peroxide, citric acid, L-lactic acid, and alcohol (ethanol or isopropanol). In fact, the [American Academy of Pediatrics](#) and some states like [California](#) and [Washington](#) have reopening guidance for childcare and schools that specifically recommend using disinfectants that don't cause and exacerbate asthma. Please take a look at the attached pdf or this link, which has more detailed information and lists a bunch of resources where you can learn more.

I want to strongly encourage [NAME OF CHILD CARE/SCHOOL] to adopt a policy of using safer disinfectants for the health of both our children and the staff. I would be happy to further discuss the importance of safer disinfectants and cleaning with you. Please let me know if I can be of help in any other way going forward to ensure the safest learning environment for our children. Thanks for listening to my concerns and leading the way during these uncertain times.

Thank you for your time,

[NAME]
